

I Claim:

1. An apparatus for conveying sheets to a sheet processing machine, comprising:

a feed table;

at least one suction belt disposed to be guided over said feed table and to be subjected to suction air from an underside thereof;

said suction belt having at least two mutually spaced-apart rows of suction openings formed therein; and

said feed table having ventilation openings formed therein in a region between said rows of suction openings formed in said suction belt.

2. The apparatus according to claim 1, which comprises mutually parallel suction boxes communicating with said rows of suction openings for supplying suction air to said rows of suction openings, and a common vacuum source communicating with said suction boxes.

3. The apparatus according to claim 2, which comprises a covering plate covering said suction boxes on top, said covering plate defining said feed table and a guide for said suction belt.

4. The apparatus according to claim 3, wherein said covering plate is formed with mutually parallel rows of suction openings and with said ventilation openings.
